ACM CODING WORKSHOP 1

Core Idea:

Coding can be far more than math and assignments, it can be used for fun! With just a basic skillset, it's pretty easy to make an enjoyable, interactive project, like a game. For this first coding workshop, try to use whatever skills you have to make a small project that you would have fun making and that you could continue to improve on in the future. Employers at the career fair love to see students who have more projects than just their class assignments.

Activity:

- (~ 5 Minutes) Brainstorm project ideas for your skill level:
  Examples:
  - Text-based adventure game using user input
  - Blackjack with math.random
  - Trivia Game in the console output

- (~ 45 Minutes) Attempt to get this project started:
  - Feel free to use any resource, but try to understand how it is working
  - *DO NOT* just use AI to write code and copy it without understanding how it works

- (~ 10 Minutes) Reflect on how it went:
  - What was easier/harder than you expected?
  - What is interesting about your program?
  - How would you improve it or do it differently?
